Draft, 31 October 2026 (repository HEAD `df9dcf4`)

Draft — tracks build in progress. This document reports exactly what the Lean development proves at the stated commit. It does *not* solve the Clay Millennium problem, and does not prove global regularity of the 3D Navier–Stokes equations. The step `PeriodicBKMIntegrability` is the open Clay core and remains an explicit hypothesis.

Abstract

We describe a Lean 4/Mathlib formalization of the classical continuation steps for smooth divergence-free solutions of the incompressible Navier–Stokes equations on the unit torus $\mathbb{T}^3$, along the Statement (B) route of the companion repository `fefferman-clay-navier-stokes`. Proved with no hypothesis Props: local existence for $\nu \geq 0$, uniqueness via an L^2 energy-difference estimate, the Fourier coefficient ODE, coefficient decay, the H^s energy identity, Parseval's identity on the unit cube, and the Kato–Ponce toolkit at $s = 3$ (integration by parts, Leibniz rule, a Gagliardo–Nirenberg inequality, a bound on every lower-order term, and vanishing of the top-order term from $\operatorname{div} u = 0$). Proved conditionally: H^3 Beale–Kato–Majda control from two named Props, `PeriodicPhysicalCommutatorBound` (not yet assembled) and `PeriodicLowFreqVorticityBound` (classical, not yet formalized), and Statement (B) from these together with the open `PeriodicBKMIntegrability`.

1 Conventions and naming

Every hypothesis is a named `Prop` passed as an explicit theorem argument; no `axiom`, `sorry` or `admit` appears. The axiom audit (`lake env lean AxiomAudit.lean`) reports only `propext`, `Classical.choice` and `Quot.sound`. Lean identifiers defined in this repository are *coined in this build* (marked [coined]), not names from the author's May/June 2026 manuscript. The identifiers `Clay_B_exact`, `PeriodicLocalExistence`, `PeriodicBKMCriterion` and `PeriodicBKMIntegrability` come from the dependency `fefferman-clay-navier-stokes` (pinned at `ebcf109`).

2 Relation to the May/June 2026 manuscript

The author's manuscript frames regularity through a tethered Lyapunov functional S_ε and a comparison ODE $y' = Cy^2 - \kappa'' y^3$, with transport cancellation, viscous dissipation, a Hölder–Sobolev

gate and Young absorption at $\varepsilon = \kappa/4$ (Proposition 2). For *unmodified* Navier–Stokes ($\kappa = 0$) the cubic damping is absent, and the remaining gap is hypothesis (H5): a non-circular majorant for the vorticity. In this repository that gap appears exactly as `PeriodicBKMIntegrability`, i.e. $\int_0^T \|\omega\|_\infty \, dt < \infty$. Nothing here closes it. The transport cancellation of the manuscript corresponds to `top_term_zero` below.

3 Proved results (no hypothesis Props)

Theorem 1 (Local existence). *`periodicLocalExistence_of_nonneg`[coined]: for $\nu \geq 0$, `PeriodicLocalExistence` holds (Galerkin method at $s = 3$).*

Theorem 2 (Energy difference / uniqueness). *`periodicEnergyDifferenceEstimate`[coined]: for $\nu \geq 0$ and two classical solutions with equal data, $E(t) = \int_{[0,1]^3} |u - v|^2$ satisfies $E' \leq 2CE$. With Grönwall (`eq_zero_of_deriv_le_mul`[coined], `periodicVelocityUniqueness_of_energy`[coined]) this gives uniqueness.*

Theorem 3 (Fourier coefficient ODE, decay, H^s energy identity). *`periodicFourierCoeffODE`[coined], `periodicFourierCoeffDecay`[coined] and `periodicFourierHsEnergyIdentity`[coined] (file `CoeffODE.lean`) prove the Props `PeriodicFourierCoeffODE`, `PeriodicFourierCoeffDecay`, `PeriodicFourierHsEnergyIdentity` for every ν (and every s): each Fourier coefficient $\hat{u}_k(t)$ obeys the projected ODE, coefficients decay faster than any power, and*

$$\tfrac{d}{dt}\|u\|_{H^s}^2 = -2\nu \textstyle\sum_k (1 + |k|^2)^s \, 4\pi^2 |k|^2 |\hat{u}_k|^2 + \textit{(nonlinear rate)}.$$

The bridge is `periodicFourierHsEnergyIdentity_of_coeff`[coined] (`HsEnergyIdentity.lean`).

Theorem 4 (Parseval on the unit cube). *`hasSum_prod_cubeCoeff`[coined] (`Parseval.lean`): for continuous periodic f, g, $\sum_k \overline{\hat{f}_k} \hat{g}_k = \int_{[0,1]^3} \bar{f} g$, via `torusLift`[coined] and Mathlib's torus Parseval.*

Theorem 5 (Physical form of the H^3 rate). *`hasSum_rate_three`[coined]: the Fourier-side H^3 nonlinear rate is summable and equals $-2\sum_i \int (1 - \Delta/4\pi^2)^3 v_i \, ((v \cdot \nabla)v)_i$.*

Theorem 6 (Kato–Ponce toolkit, $s = 3$; `KatoPonce.lean`). *Proved: unit-cell integration by parts `cellI_ibp`[coined], `cellI_ibp'`[coined]; Leibniz rule `DL_mul`[coined]; Gagliardo–Nirenberg on the cell `gagliardoNirenberg_cell`[coined] and `cellI_sq_mul_abs_le`[coined]; and*

- *`lower_term_bound`[coined]: every lower-order Leibniz term (first factor of order ≥ 1) satisfies $|\int D^L v_i \cdot D^{p_1} v_l \, D^{p_2} \partial_l v_i| \leq 5 \|\nabla v\|_\infty \, Q(v)$, with $Q =$ `physQ`[coined];*
- *`top_term_zero`[coined]: $\sum_{i,l} \int D^L v_i \, v_l \, D^L \partial_l v_i = 0$, because $\operatorname{div} v = 0$ (transport cancellation).*

Theorem 7 (Continuation alternative). *`periodicBKMCriterion_of_hsControl`[coined]: for $\nu \geq 0$, $s > 5/2$, `PeriodicBKMHsControl` ν s implies `PeriodicBKMCriterion` ν (the H^s blow-up alternative is proved).*

4 Conditional results

Named hypothesis 1. `PeriodicPhysicalCommutatorBound C`[coined] (s=3): for smooth periodic divergence-free v, $-2\sum_i \int (1 - \Delta/4\pi^2)^3 v_i \, ((v \cdot \nabla)v)_i \leq C \|\nabla v\|_\infty \|v\|_{H^3}^2$. *Status:* not yet proved; `lower_term_bound` and `top_term_zero` are its two analytic ingredients. Remaining: per-term bound summed over the Leibniz expansion, matching Fourier weights, comparison of Q with the H^3 norm, final assembly.

 © 2026 Benjamin Stanley Frohman. Apache-2.0.

Named hypothesis 2. `PeriodicLowFreqVorticityBound`[coined]: $\exists K \geq 0$, $\forall R \geq 2$, $\|V_R \nabla v\|_\infty \leq K(1+\log R)\|\omega\|_\infty$. *Status:* classically true (Littlewood–Paley/Calderón–Zygmund), not formalized.

Named hypothesis 3. `PeriodicBKMIntegrability` ν (from `fefferman-clay-navier-stokes`): $\int_0^T \|\omega\|_\infty < \infty$ on every finite interval of existence. *Status:* **open**. This is the Clay core and the manuscript's (H5) gap.

Proposition 8. *`periodicFourierCommutatorBound_of_physical`*[coined]*: `PeriodicPhysicalCommutatorBound C` ⇒ `PeriodicFourierCommutatorBound 3 C`. `periodicBKMHsControl_of_physical_lowFreq`*[coined]*:* (∃$C \geq 0$, *`PeriodicPhysicalCommutatorBound C`*) *and `PeriodicLowFreqVorticityBound` give `PeriodicBKMHsControl` ν 3.*

Proposition 9 (Statement (B), conditional)**.** *`clay_B_exact_of_hsControl`*[coined]*: for $s > 5/2$, `PeriodicBKMHsControl` ν s and `PeriodicBKMIntegrability` ν give `Clay_B_exact` ν. Also `clay_B_exact_of_cor` and `clay_B_exact_of_bkm`*[coined]*.*

Note on a failed route. A Wiener-algebra/Fourier commutator estimate was tried and abandoned: its low-frequency part grows like $R^{3/2}$, not $\log R$. The $s = 3$ physical-space estimate replaces it.

5 Status

- **Proved, unconditional:** local existence ($\nu \geq 0$), uniqueness, coefficient ODE and decay, H^s energy identity, Parseval, physical form of the H^3 rate, Kato–Ponce toolkit including `lower_term_bound` and `top_term_zero`, the blow-up alternative.
- **Conditional:** H^3 BKM control on `PeriodicPhysicalCommutatorBound` and `PeriodicLowFreqVorticityBo` Statement (B) additionally on `PeriodicBKMIntegrability`.
- **In progress:** assembly of `PeriodicPhysicalCommutatorBound`. **Not formalized:** `PeriodicLowFreqVorti`
- **Open:** `PeriodicBKMIntegrability` — the Clay Millennium core. Neither the Clay problem nor global regularity of 3D Navier–Stokes is claimed.

Reproducibility

`lake build`; `lake env lean AxiomAudit.lean` (0 `sorry`; only `propext`, `Classical.choice`, `Quot.sound`).
